

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of claims:

Claims 1-2 (cancelled).

Claim 3 (currently amended): A system for detecting errors in balance related screening tests, the system comprising:

a force-plate for measuring forces to determine a quantity related to a stability factor of a balance task performed in trials by a subject under a plurality of distinct sensory conditions; and

a computation device in communication with the force-plate, the computational device (i) receiving the quantity related to the stability factor for each trial, (ii) determining a rank order for the quantities, each quantity for each trial being associated with a rank, and (iii) determining if any of the ranks associated with a given one of the trials has fallen outside a reference range associated with the given trial performed under error-free conditions.

Claim 4 (original): A system according to claim 3, further comprising a display device in communication with the computational device for indicating an instance wherein any of the ranks associated with a given one of the trials has fallen outside a reference range associated with the given trial.

Claim 5 (cancelled).

Claim 6 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with an average.

Claim 7 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with a standard deviation.

Claim 8 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with a standard error.

Claim 9 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with a power spectrum.

Claim 10 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with a root mean square.

Claim 11 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, wherein the statistical quantity represents a value associated with a frequency histogram.

Claim 12 (cancelled).

Claim 13 (currently amended): A method for detecting a screening-test error, the method comprising:

measuring at least one performance parameter related to at least one screening-test task performed by a subject; and

calculating at least one performance statistical quantity characterizing the measured performance parameter; and

comparing the at least one performance statistical quantity to at least one reference statistical quantity associated with an error-free screening test,

~~according to claim 5~~ wherein:

(i) the screening-test task is a balance task;

(ii) the at least one performance parameter is vertical force applied to a force plate;

(iii) the at least one performance statistical quantity corresponds to a moving window average value for total vertical force applied to the force plate; and

(iv) comparing the at least one performance statistical quantity to the at least one reference statistical quantity includes determining whether the moving window average value deviates from a constant value by a predetermined threshold value.

Claim 14 (currently amended): A method for detecting a screening-test error, the method comprising:

measuring at least one performance parameter related to at least one screening-test task performed by a subject; and

calculating at least one performance statistical quantity characterizing the measured performance parameter; and

comparing the at least one performance statistical quantity to at least one reference statistical quantity associated with an error-free screening test

~~according to claim 5~~, wherein:

(i) the screening-test task is a balance task;

(ii) the at least one performance parameter is vertical force applied to a force plate;

(iii) the at least one performance statistical quantity corresponds to an average of a mathematical derivative of the total vertical force applied to the force plate; and

(iv) comparing the at least one performance statistical quantity to the at least one reference statistical quantity includes determining whether the average deviates from zero by a predetermined threshold value.

Claim 15 (currently amended): A method for detecting a screening-test error, the method comprising:

measuring at least one performance parameter related to at least one screening-test task performed by a subject; and

calculating at least one performance statistical quantity characterizing the measured performance parameter; and

comparing the at least one performance statistical quantity to at least one reference statistical quantity associated with an error-free screening test

~~according to claim 5~~, wherein:

- (i) the screening-test task is a balance task;
- (ii) the at least one performance parameter is horizontal force applied to a force plate;
- (iii) the at least one performance statistical quantity corresponds to an average of a mathematical derivative of the total horizontal force applied to the force plate; and
- (iv) comparing the at least one performance statistical quantity to the at least one reference statistical quantity includes determining whether the average deviates from zero by a predetermined threshold value.

Claim 16 (currently amended): A method according to ~~claim 5~~ any of claims 13-15, further comprising displaying the extent to which the at least one performance statistical quantity differs from the at least one reference statistical quantity on a display device.

Claims 17-24 (cancelled).

Claim 25 (new): A system according to claim 4, wherein the display device displays a number corresponding to the number of times a performance of the balance task by the subject has fallen outside the reference range.

Claim 26 (new): A system according to claim 3, wherein measuring the quantity related to a stability factor includes following a modified CTSIB protocol.

Claim 27 (new): A system according to claim 3, wherein determining a rank order for the performance of the plurality of distinct tasks includes determining a rank order according to the level of difficulty of the balance tasks.
